The Point Four Microbubble Oxygen Diffusers

**A Simple and Cost
Effective Way
of Dissolving Gases
in Water**

One of the simplest ways to dissolve gases, such as oxygen or carbon dioxide, in water is to introduce the gas as small bubbles. The smaller the bubbles, the more efficient will be the absorption of the gas.

The Point Four microbubble oxygen diffusers (available in 4 sizes) produce a cloud of extremely fine bubbles, 100 to 500 microns, much finer than graphite diffusers or porous hose. Bubbles do not coalesce because Point Four diffusers are flat.

The Point Four diffuser employs an ultra fine pore ceramic plate producing uniform bubbles across its entire surface. Ceramic is a clean, inert material.
